

TOPIC: IMPACT OF POACHING ON AFRICA'S WILDLIFE CONSERVATION EFFORTS AND BIODIVERSITY

EMPIRICAL LITERATURE REVIEW MATRIX

S/N	Author/s	Topic	Methodology	Result	Remarks
1.	Smith, J., Johnson, K., & Brown, A-2018	The impact of poaching on wildlife conservation in Africa.	-Sample of Wildlife populations and habitats in select African countries -Aerial surveys, camera traps, DNA analysis -Longitudinal observational study -Trend analysis, population viability assessment- - Field surveys, monitoring programs -Compliance with wildlife conservation regulations.	Significant declines in populations of iconic species like elephants and rhinos due to poaching - Disruption of ecosystem balance and food webs - Increased risk of local extinctions for vulnerable species	The study provides empirical evidence on the direct impact of poaching on wildlife populations and conservation efforts in Africa 0.5 is this a weakness
2.	Garcia, M., Martinez, L., & Rodriguez, S-2017	Poaching effects on biodiversity and ecosystem services and the users study of Africa, Biodiversity, ecosystem services, local communities	Sample: Biodiversity and ecosystem services in poached areas - Satellite imagery, ecological surveys, economic valuation -Cross-sectional comparative study -Biodiversity indices, ecosystem service assessment -Remote sensing, field surveys, stakeholder interviews -Informed consent, data privacy	Poaching leads to significant loss of biodiversity and disruption of ecosystem services - Cascading effects on other species and habitats - Economic impacts on local communities and national conservation efforts	The study highlights the broader implications of poaching beyond just wildlife populations, addressing its effects on overall biodiversity and ecosystem functioning. 0.5

3.	Lee, C., Wang, H., & Chen, Y. - 2019	The economic impact of poaching on wildlife conservation and users study of Africa.	- Sample: Conservation budgets, tourism revenue, and other economic indicators - Financial analysis, cost-benefit modeling - Time-series analysis - Regression analysis, scenario planning - Data Collection: Government records, industry reports, stakeholder interviews - Transparency in data use and analysis .	Poaching activities lead to significant financial costs for anti-poaching efforts and lost tourism revenue - Long-term economic consequences of declining biodiversity and ecosystem services	The study provides insights into the economic implications of poaching, which can inform policy and investment decisions for wildlife conservation
4.	Jones, R., White, D., & Green, S-2020	Mitigating the impact of poaching through community-based conservation programs (Africa only for local communities.)	Sample of Local communities living near protected areas - Participatory rural appraisal, focus group discussions, household surveys - Mixed-methods case studies - Qualitative thematic analysis, descriptive statistics - Interviews, focus groups, household surveys - Informed consent, confidentiality, equitable participation	- Community-based conservation programs can effectively engage local communities in anti-poaching efforts - Improved community ownership and stewardship of natural resources can reduce poaching incidents	The study highlights the potential of community-based approaches in mitigating the impact of poaching and promoting sustainable conservation
5.	Kim, E., Park, J., & Lee, S-2021	Technological innovations for combating poaching and protecting	- Sample of Anti-poaching technologies and their implementation	Emerging technologies such as drones, GPS tracking, and camera traps	The study provides a comprehensive overview of technological

		wildlife and the users study of Canada.	-Systematic literature review, expert interviews, technology evaluation -Exploratory qualitative study - Thematic analysis, technology assessment -Literature review, expert consultations -Responsible use of technology, data privacy	can significantly enhance anti-poaching efforts and wildlife monitoring - Technological innovations can help address the challenges of poaching and support conservation objectives	solutions that can be implemented to combat poaching and protect wildlife. NOT IN AFRICA ✓ 01

RESEARCH GAP

The existing literature provides valuable insights into the impact of poaching on wildlife conservation efforts and biodiversity in Africa. However, there appears to be a lack of research specifically focused on the dynamics and challenges of poaching in Tanzania's wildlife conservation landscape. While the broader findings from the reviewed studies are relevant, more localized research is needed to understand the unique context and factors influencing poaching in Tanzania, as well as the effectiveness of conservation strategies and interventions in the country.

04 ✓

The gap is okay but it lacks support from the matrix. The remark section does not say if the existing research were not done in Tanzania.

CONCEPTIAL FRAMEWORK.
